

NovaTech Solutions — Revenue Intelligence Dashboard

Executive Report for Sarah Chen, VP

1. Executive Summary

The Revenue Intelligence Dashboard combines NovaTech's CRM deals, marketing campaigns, and support tickets into three views: Marketing Funnel, Sales Pipeline, and Customer Health. It provides leadership with a unified view of revenue performance, marketing effectiveness, sales execution, and customer risk. The analysis is descriptive and diagnostic; the project does not require predictive forecasting or real-time data.

2. Data Strategy

The three source datasets are connected through the common `account_id` field. CRM supplies deal, account, product, sales-rep, region, stage, and deal-value information. Marketing supplies campaign, channel, funnel-stage, response, spend, and attributed-revenue information. Support supplies ticket creation/resolution, priority, product area, sentiment, customer tier, and regional information.

A unified dataset was created using `account_id` joins. Because an account can have multiple marketing and support records, joins can produce repeated rows; distinct identifiers are therefore used where appropriate for lead and ticket counts.

3. Dashboard Design Rationale

The Marketing Funnel view focuses on channel performance, funnel stages, campaign response, and ROI. The Sales Pipeline view focuses on deal outcomes, product revenue, regional win rates, sales-cycle duration, and average deal value. The Customer Health view focuses on ticket volume, resolution time, product-area issues, sentiment, and account-level risk. Filters and `account_id` support interactive cross-view analysis.

4. Key Business Insights

Area	Finding
Marketing	Direct Mail has the highest conversion/response rate: 50.75% (68/134).
Marketing	All six campaigns have negative ROI; NovaPulse Launch is best at about -81%.
Sales	Central has the highest regional win rate at about 72%.
Sales	Standard customer segment has the highest average deal value at about \$2,023.81.
Sales	Mei Lin Zhang has the longest average sales cycle at about 126.23 days.
Customer Health	Low-priority tickets average 2.05 days to resolve, versus 1.92 high and 1.91 medium.
Customer Health	Negative sentiment has 630 tickets versus 288 positive tickets.
Customer Health	Notifications (567) and Analytics Dashboard (561) have the highest ticket volumes.

5. AI Analysis and Dashboard Verification

Natural-language Q exploration was used to test business questions against the dashboard. Questions covered campaign conversion, average deal value, support resolution time, high-ticket-volume accounts, and campaign ROI. The Q responses were checked against the corresponding dashboard visuals. For example, Q identified Direct Mail at 50.75% conversion, consistent with the Marketing Funnel view.

6. Recommendations

- Review campaign economics before increasing marketing spend.
- Study Central-region practices and higher-value customer segments for repeatable sales approaches.
- Investigate unusually long sales cycles and deal-stage bottlenecks.
- Prioritize customer-success outreach for accounts with high recent ticket volume, negative sentiment, and high deal value.
- Investigate Notifications and Analytics Dashboard ticket drivers for recurring product or support issues.

7. Scope and Limitations

The dashboard is intended for descriptive and diagnostic revenue intelligence. It does not include predictive modeling or forecasting, and weekly data freshness is sufficient for the stated requirement.
